I have Created 3 Micro-Services

Wallet is the Main Controller through which I can access any controller. I have added a Security Controller as well for authentication.

First Create Customer then his BankAccount and Finally the wallet.

Main Microservice Port : 8081

bank-transaction-billing Microservice Port: 8082

Customer-beneficiary Microservice Port: 8083

For Initial Login use : username = "Admin" and Password = "admin" and then can use the generated token for accessing the controllers in Wallet.
After creating the customers we can use their username and password as well for generating a token.

Authentication is done by security controller in Main Microservice.
